Strategic Implication: TBD

Japan K-Car Landscape (CY25/9YTD)

MSRP JPY Mils **Potential Enablers for BYD Racco to Win in Japan's K-Car Segment (Hypothetical MSRP Positioning)**

Racco Potential Enablers:

- Battery vertical integration
→ cost leverage
- Potential ICE-adjacent MSRP positioning
- Rich equipment & UI/UX perceived value
- Fit with high-volume tall passenger K-Wagon segment

Challenges to Scale:

- Brand familiarity in Japan
- Dealer network footprint and coverage

Note:

- MSRP of existing EVs = Median from CarView Website
- Racco prototype pricing is not disclosed as of Oct 30.
- Racco MSRP positioning shown here is hypothetical (author assumption).

Strategic Implication: Achieving ICE-adjacent pricing through battery vertical integration, combined with high perceived equipment/UI/UX value, represents a viable path to unlock K-EV volume in tall passenger segments.

BYD Racco (K-BEV): Early Customer Signals At Japan Mobility Show

Follow-up on my Oct 30 LinkedIn post, below are some insights from JMS visit:

Early Voice of the Customer Signals (VoC):

👤 Middle age male
(automotive industry insider)

Product is good. Definitely BYD can sell a certain number of Racco. It will depend on **dealer presence including serviceability.**

👫 Young couple (first-time EV consideration in urban use)

Wow, this is good. We should consider to buy it **if the price is ok.**

🚗⚡🧠🤖 Young male
(range-anxiety persona)

Not bad. I'm curious about the **range** on a full charge — and where I can charge it.

Strategic Implication: Japan's K-BEV adoption is not limited by product fundamentals, but rather by:

- Dealership density & aftersales confidence
- Price adjacency vs ICE K-segment
- Perceived charging convenience
